SUMMARY

Computer Engineering graduate (2024) and M.Sc. student. I am a backend developer working with .NET and C#. I build microservices and event-driven systems using Clean Architecture and CQRS. I care about clean code, good tests, and systems that are fast and reliable. I have hands-on experience with RabbitMQ, Redis, PostgreSQL, and Docker. I also have real product experience from a SaaS side project (PHP, Linux). Open to relocation. Military service deferred until 2029.

FEATURED PROJECTS

Online Learning Platform — Microservices E-Learning System (in development) [GitHub](#)

.NET 10 · Microservices · Clean Architecture · CQRS/MediatR · RabbitMQ · Redis · PostgreSQL · JWT · Docker · Azure · YARP API Gateway

- Building an e-learning backend as four independent microservices (Identity, Catalog, Enrollment, Notification), each owning its PostgreSQL database (database-per-service).
- Synchronous calls over REST; asynchronous events over RabbitMQ.Client — low-level implementation with exchanges, durable queues and manual acknowledgements for loose coupling and service independence.
- Designed for reliability and scalability: Redis-backed idempotent event handling prevents duplicate processing, Polly resilience policies guard inter-service calls, and Redis caching with role-based authorization powers the Catalog service.
- Structured every service with Clean Architecture and CQRS; MediatR pipeline behaviors centralize validation (FluentValidation) and performance monitoring; structured logging with Serilog + Seq; domain exception hierarchy with global exception middleware.
- Integration tests run against real PostgreSQL, Redis and RabbitMQ instances via Testcontainers (xUnit). Architecture documented with sequence diagrams, an event catalog and ADRs. Next on the roadmap: YARP API Gateway, GitHub Actions CI/CD, Azure Container Apps deployment and load testing.

RestaurantBill — POS & Kitchen Display System [GitHub](#) [Live demo](#)

.NET 9 · Clean Architecture · CQRS/MediatR · SignalR · PostgreSQL · JWT · React 19 · Docker · xUnit · k6

- Developed** a full-stack Point of Sale (POS) and Kitchen Display System (KDS) utilizing **.NET 9, Clean Architecture, and CQRS (MediatR)**, featuring real-time data synchronization across clients via **SignalR**.
- Designed and executed** load/stress tests using **k6**, identifying and resolving logical bottlenecks (table contention) to optimize the system to handle **100 concurrent users** with a **0% error rate** and a **3.7s p(95) response time**.
- Implemented** cross-cutting concerns (validation, logging, performance tracking) via MediatR pipeline behaviors, ensuring a DRY and maintainable architecture.
- Containerized** the application stack using **Docker Compose** and established automated CI/CD pipelines with **GitHub Actions** for seamless deployment to a **local cloud provider**, significantly reducing network latency for real-time operations.
- Secured** endpoints with JWT role-based authorization (Admin, Waiter, Kitchen, Cashier) and ensured domain logic reliability with isolated unit tests using **xUnit and Moq**

TECHNICAL SKILLS

Languages & backend: C#, .NET 9/10, ASP.NET Core Web API, Entity Framework Core, LINQ, async/await

Fundamentals: OOP, SOLID, data structures & algorithms, design patterns

Architecture: Clean Architecture, CQRS (MediatR), Microservices, DDD, YARP API Gateway, Repository + Unit of Work

Messaging & real-time: RabbitMQ (exchanges, durable queues, manual ack), SignalR

Reliability & caching: Polly (retry, circuit breaker), Redis (caching, idempotency)

Databases: PostgreSQL, MS SQL Server, EF Core Migrations, SQL query optimization

DevOps & cloud: Docker Compose, GitHub Actions CI/CD, Git, Azure Container Apps, Linux server administration

Testing: xUnit, Moq, Testcontainers, AAA pattern, k6 (load/stress/smoke)

AI tooling: AI-assisted development with Claude and GitHub Copilot as part of the daily workflow

Frontend & secondary: React 19, TypeScript, Tailwind CSS · PHP, MySQL

EXPERIENCE

Cyftech (Katsis) — Co-founder & Backend Developer katsis.com.tr

2023 – Present

Building-management SaaS side project with university friends · 3-person team · PHP, MySQL, Linux

- Own the backend of a multi-tenant SaaS — REST API design, data modelling and tenant isolation.
- End-to-end responsibility for Linux server setup, deployment and basic CI/CD processes.
- Experienced the full product cycle in a small, fast-iterating team: requirements → architecture → development → testing → deployment.

IAS (Industrial Application Software) — Software Developer Intern

Nov – Dec 2023

Istanbul · Enterprise ERP team

- Contributed to enterprise ERP modules in a structured team with code reviews and SOLID practices.
- Optimized reporting SQL queries over high-volume datasets, improving data access times.

EDUCATION

Sivas Cumhuriyet University — Computer Engineering · M.Sc., Sep 2025 – present · B.Sc., graduated 2024

Military service deferred until 2029 (graduate studies) · Available across Türkiye, open to relocation · Turkish (native), English (B2)
